Hawaiian Island Homes Ltd.

Wood...The "Green" Choice

Fourth in a series on the "Greening" of Hawaii's housing industry.

In planning a new home, the builder, designer, and client are faced with a myriad of choices regarding materials. The factors that will influence them are principally budget, aesthetics, lifestyle issues, durability, and now, perhaps more than ever before, environmental impact considerations.

Most homes in the U. S. are constructed with a combination of materials...wood, both natural dimensions and engineered, steel,

concrete, vinyl, glass, tile, and more. However, the principal component of the vast majority of homes throughout the U. S. is wood. A house may be framed with either wood, concrete, or steel, but usually the flooring, siding, doors, interior finishes, and trim are fabricated with wood.

A house constructed primarily of wood is generally the least expensive to build for a variety of reasons. The material itself has reached a 15 year low in pricing per thousand board feet, while the cost of other building materials

has escalated. Construction time for a wood house is generally less than that required to build a house in which steel and concrete are major components, meaning savings in terms of man hours. The difference in cost is even greater for hillside home sites where wood can easily be hauled but concrete work can be problematic.

In terms of durability, homes built of wood that has been properly dried, pressure treated, and maintained are resistant to both adverse Hawaii weather conditions and insects and can last for centuries. The oldest known frame house in the U. S., located in Massachusetts, is nearly 400 years old.

When it comes to aesthetics, wood offers more variety and design options than any other material. Each piece of wood is unique visually...no two pieces look exactly the same.

But what about environmental impact concerns? Are lumber companies depleting our forests to produce wood for home building? Quite the contrary. Today, there are 747 million acres of forestland in the U. S., about 71% as much as in 1630...and the same amount of land is covered by trees (or

slightly less) as in 1907. Each year about 1.7 billion tree seedlings are planted, roughly 4.0 million a day, more than making up for those that are harvested.

According to Dr. Patrick Moore, co-founder of Greenpeace, author of "Green Spirit - Trees Are The Answer," and now president of Greenspirit, an environmental consultant to government and industry, "the environmental movement has unfortunately led the public into believing that when people use wood, they cause the loss of forests. This widespread guilt is misplaced because North America's forests are not disappearing. In fact, there is about the same amount of forest cover today as there was 100 years ago, even though we consume more wood per capita than any other region in the world. When we buy wood, we are sending a signal to plant more trees to satisfy demand. If there were no demand for wood, landowners would clear away the forest and grow something else instead."

He points out that commonly held Green design standards call for buildings to be constructed of recycled or recyclable materials when, in fact, wood as a renewable material offers greater Green value. The environmental impacts and costs associated with the recycling of such materials as steel, concrete, and plastic, among others, are known to be less than producing new supplies from the earth's finite resources, but these impacts and costs are still much greater than those created by the production of wood for home building. Any product that starts with consuming the earth's finite resources to produce

Vac has own entry but can be connected as 1 whole estate. Mls 2708995.

Wood...The "Green" Choice

Continued from page 1

an original product capable of being recycled into other new, alternate, and replacement products fails the Green tests of sustainable

Al Huber
Director, Hawaii Lumber Products Association
Manager, Weyerhaeuser Company iLevel Division, Columbia Region

Hap Person
President, Hawaii Lumber Products Association
President, Honolulu Wood Treating

and renewable. When it comes to building homes and low-rise buildings, however, wood is the only true renewable and sustainable major building material that can be defined as very Green because it uses the sun's energy to renew itself in a continuous, sustainable cycle.

The Hawaii Lumber Products Association (HLPAs) was formed in 2003 to promote lumber products as a preferred building material based on the proven track record of wood and its achievement of long-term performance in Hawaii's construction industry as well as a renewable building material resource that provides benefits to the environment.

HLPAs President Hap Person is president of Honolulu Wood Treating, Hawaii's largest wood treatment facility and wholesale distributor of building mate-

rials. "Builders like wood because it's easy to work with using standard techniques and equipment, architects like it because of its visual variety and versatility in terms of workmanship, and home owners like it because of its durability and proven structural dependability," Person said.

"Another feature, of particular interest in Hawaii, is that a standard wood framed wall without added thermal breaks or insulation is 400 times less heat conductive than light gauge steel wall assemblies and 8.5 less than concrete. Of course, any framing material can be insulated against heat conductivity, but then you are looking at added cost. This is one of the features that we consider in assessing wood as an affordable building material.

"Wood also holds up well in the Hawaiian climate with its high moisture and salt air...it also withstands climate changes better than most materials. However, like any other building material it has to be prepared and used properly. State building codes and nationally approved wood pressure-treatment standards for Borate-based treatments, such as Hi-Bor, safeguard wood against both Hawaii's weather conditions and insect attacks.

"The borate used in Hi-Bor-treated wood is a naturally occurring mineral used in many consumer products like hand soap and eyewash and is an important plant nutrient. Borate has the unique ability to be drawn deep into the wood's fibers by the natural moisture in wood prior to drying, which provides greater penetration to prevent decay or termite activity. Once the borate dries, it returns to a solid mineral form providing long term protection. Some borate wood treatments offer a 20 year structural warranty against termites and decay, but can actually remain effective for a lifetime."

Al Huber, a member of the HLPAs Board of Directors and Manager of the Columbia Region of iLevel, a division of Weyerhaeuser Company, said one of the association's priorities is to dispel the myth that the industry is over-harvesting trees in the

nation's forests. The world's largest owner of forest lands with over six million acres in the U. S., Weyerhaeuser harvests only one to three percent of its timberlands and plants more than 100 million seedlings annually. Weyerhaeuser forest lands are operated within the stringent environmental standards set by the Sustainable Forest Initiative (SFI) in the U. S. and the Canadian Standards Association (CSA) in Canada.

Huber pointed out that 98 percent of all timber products brought to a mill are turned into a usable product, including fuel to offset the use of fossil fuels in running the mill. Mulch and bark for ornamental landscaping, chips for pulp and paper, and sawdust for the manufacture of some paneling are other by-products.

"Probably the biggest change in the industry has been the development of engineered wood products, or 'EWP,'" Huber said. "TimberStrand LSL, or laminated strand lumber, is a wood product fabricated from wood strands bonded with adhesives that offers the predictability of steel with the versatility of lumber and consistent uniformity. The product comes in lengths of up to 64 feet and widths of up to eight feet and is strong enough and straight enough to be used for joists and beams. Certain types of EWP, such as Parallam PSL, or parallel strand lumber, have a rough sawn appearance and are suitable for use in exposed view applications. We also have an engineered wood decking product, ChoiceDeck, which has a wood grain that takes stain as well as natural wood and resists warping and water infiltration.

"By using more lumber, we are actually generating the planting of more trees. As the demand increases, the lumber companies acquire more unforested land where they plant trees that will eventually be harvested. Most lumber today is not taken from public forests, but from replanted private lands. Despite the increase in population and urban development, there are more trees growing in the U. S. and Canada today than there were 100 years ago."
